

Project Description

The State of New York recently instituted an initiative to make broadband internet accessible to every household within the state. As a result, telecommunication companies have been designing and contracting required services with a relatively short implementation schedule, creating peak demands on limited numbers of resources.

BH's Approach

To respond to this demand for construction services, D&D Power | BHI Energy developed a comprehensive offering for the many telecommunications companies that are not normally accustomed to this significant level of construction and the required support services. The bulk of the work, called "Make Ready" required utility-approved construction crews to prepare utility-owned power structures to support additional communications related facilities.

Scope Description

Associated activities included pole change-outs, adding secondary services, conductor adjustments, additional guying, transformer change-outs and other tasks required to bring existing structures up to current construction standards.

Project Challenges Resolved

We addressed these customer needs by providing a full complement of project management services including material procurement and management, scheduling, maintenance, construction and customer liaison with project design groups, the utility and the end user.

Customer Feedback

As we progress with our current customers, we've found our customer base steadily increasing in recognition of the success of our comprehensive offering.
