Posting Radiological Hazards

RP 02.04
RP 03.04

Approved Rev: 11/29/17
The Standardized Task Evaluation (STE) program promotes a work-ready workforce through the standardization of common tasks by defining the knowledge and skills required to perform a given task. Subject Matter Experts (SMEs) analyze the task and generate lesson plans, knowledge examination, and performance evaluation elements. These elements are combined to create an STE package.

The Electric Power Research Institute (EPRI) facilitates the development, oversees the quality, and programmatically implements each STE. EPRI STE members have access to these materials and permission to implement these STEs in accordance with their site training and qualification procedures.
Posting Radiological Hazards Overview

- This training covers the knowledge elements needed for the posting of radiological control areas within the RCA, Restricted Area, Controlled Area, and Unrestricted Area (Junior Technician Qualification RP 02.04) as well as the knowledge elements associated with posting High Radiation Areas (HRA), Locked High Radiation Areas (LHRA), and Very High Radiation Areas (VHRA) (Senior Technician Qualification RP 03.04). Posted area construction requirements are covered as well.
Terminal Objective

- When working as an RP technician at a US nuclear utility, individual will be able to establish boundaries, barriers, and postings necessary to inform workers of the radiological hazards in the work area in accordance with the standards of NISP-RP-04, Nuclear Industry Standard Process for Radiological Posting and Labeling.
Enabling Objective

1. Define the following terms
   - RCA
   - Radiation Area
   - High Radiation Area
   - Locked High Radiation Area
   - Very High Radiation Area
   - Neutron Area
   - Radiography Area
   - Contaminated Area
   - High Contamination Area
   - DRP Area
   - Alpha 2 Area
   - Alpha 3 Area
   - Airborne Radioactivity Area
   - Hot spot
Enabling Objective

2. State the proper hierarchy for pocket inserts on postings.
3. State posting requirements for catch containments.
4. State posting and boundary requirements for a Neutron area.
5. State postings and boundary requirements for a Radiography area.
6. Identify the posting and boundary requirements for the following:
   - High Radiation Area
   - Locked High Radiation Area
   - Very High Radiation Area
   - Contaminated Area
   - High Contamination Area
   - DRP Area
   - Airborne Radioactivity Area
   - Radiation Area
Enabling Objective

7. State posting required for a ladder storage area (to include staged ladders, portable power lifts, and tele towers).

8. State the boundary controls and posting requirements for an Alpha 2 Area.

9. State the boundary controls and posting requirements for an Alpha 3 Area.

10. State the labeling requirements for containers with radioactive material.

11. State the containers which are exceptions to labeling requirements for containers with radioactive materials.
Definitions

Definitions are in accordance with NISP-13 Glossary. In some cases the posting criteria is more conservative than the area definition.
Definitions – RCA

- **Radiologically Controlled Area (RCA)** - An area within the restricted area posted in accordance with procedures for the purpose of protecting individuals against undue risks from exposure to radiation and radioactive materials.
Definitions – Radiation Area

▪ An area accessible to individuals where individuals may receive dose equivalent in excess of:
  – 5 mrem/hour @ 30 cm

▪ Requires conspicuous posting at entry point and external to the Radiation Area.
Definitions – High Radiation Area

**High Radiation Area (HRA)** - Any area, accessible to individuals, in which radiation levels from radiation sources external to the body could result in an individual receiving a dose equivalent in excess of 0.1 rem (100 mrem) in 1 hour at 30 centimeters from the radiation source or 30 centimeters from any surface that the radiation penetrates.

- **Definition: >100 mrem/hr @ 30 cm**

- **Posted at ≥ 80 & < 800 mrem/hour @ 30 cm**

- **A barrier is required for the boundary except while the area is accessed.**
Definitions – Locked High Radiation Area

Locked High Radiation Area (LHRA) - Any area accessible to individuals in which deep dose equivalent rates are greater than or equal to 1 rem per hour (but less than 500 rads in one hour at 1 meter) 30 centimeters from the source of radiation or from any surface that the radiation penetrates.

- Defined as ≥ 1 rem/hr @ 30 cm
- Posted at > 800 mrem/hour @ 30 cm
- A LOCKED barrier is required for the boundary except while the area is accessed.
Definitions – Very High Radiation Area

**Very High Radiation Area (VHRA)** - An area, accessible to individuals, in which radiation levels from radiation sources external to the body could result in an individual receiving an absorbed dose in excess of 500 rads (5 grays) in 1 hour at 1 meter from a radiation source or 1 meter from any surface that the radiation penetrates.

- \( \geq 500 \text{ rads/hour at 1 meter from any source or surface} \)

- A locked barricade or Access Control Guard is required
Definitions – Neutron Area

- **Neutron Area** – An area where the neutron dose rate is > 4 mrem/hour General Area at 30 cm from a source.

- Η > 4 mrem/hour General Area or @ 30 cm from a source
Definitions – Radiography Area

- **Radiography Area** - A radiographic work area posted and controlled in accordance with the licensee (radiography group) Operating and Emergency Procedures.

- Boundary locations established in accordance with a Radiography Shot Plan of NISP-RP-09

- Access point are posted with access controls established per Shot Plan.
  - High Radiation Areas established iaw the radiographer’s policy
  - Radiation Area boundaries shall be established where the expected dose rate is expected to be < 2 mrem/hour while the source is exposed.
  - Access control will be established at the projected Radiation Area boundary at <2 mrem/hr.
Definitions – Contaminated Area

- **Contaminated Area** - An area having smearable contamination equal to or greater than 1000 dpm/100 cm² (100 net counts per minute using a pancake frisker probe) beta- gamma or 20 dpm/100 cm² alpha.

- $\geq 1,000 & < 100,000 \ \beta\gamma$
- OR
- $\geq 20 \ \alpha \ \text{dpm/100 cm}^2$
Definitions – High Contamination Area

- **High Contamination Area (HCA)** - An area where the majority of the area has removable surface contamination equal to or greater than 100,000 dpm/100cm² beta-gamma.

- \( \geq 100,000 \ \beta\gamma \ \text{dpm}/100 \ \text{cm}^2 \)
Definitions – DRP Area

▪ **Discrete Radioactive Particles (DRP)** - Small, loose, highly radioactive particles with > 500,000 dpm or 50,000 ccppm.

▪ DRPs > 500,000 dpm

OR

▪ > 50,000 ncpm
Definitions – Alpha 2 Area

- **Alpha Level 2 (Significant)** - Relative abundance of alpha contamination is significant. The $\beta\gamma/\alpha$ ratio is between 30,000 and 300. Alpha inhalation contributes from 10 to 90 percent to the total inhalation hazard. Contamination survey action levels are intended to alert radiation safety personnel of presence of alpha emitters.

  - $\beta\gamma/\alpha$ ratio = 300 - 30,000

  AND

  - $\alpha \geq 20$ dpm/100 cm²
**Definitions – Alpha 3 Area**

- **Alpha Level 3 (Elevated)** - Relative abundance of alpha contamination is elevated. The $\beta\gamma/\alpha$ ratio is less than 300. Alpha inhalation contributes 90 percent or more to the total inhalation hazard. Most smears and all air samples should be counted for alpha contamination.

- $\beta\gamma/\alpha$ ratio $\leq 300$

  **AND**

- $\alpha \geq 20$ dpm/100 cm$^2$
Definitions – Airborne Radioactivity Area

**Airborne Radioactivity Area (ARA)** - A room, enclosure, or area in which airborne radioactive materials, composed wholly or partly of licensed material, exist in concentrations in excess of the values of 10CFR20, Appendix B, Table 1, Column 3 (i.e., DAC values) OR to such a degree that an individual without respiratory protective equipment could exceed, during the hours an individual is present in a week, an intake of 12 DAC-hours.

- Particulates & Iodine ≥ 0.3 DAC

  OR

- Noble Gas ≥ 1.0 DAC
Definitions – Hot Spot

**Hot Spot** - Accessible hot spots when components have contact readings of more than 100 mrem/hour and more than five times the general area dose rates (typically 30 cm from the source).

Localized source of radiation where contact dose rates are:
- > 100 mrem/hour
  AND
- > 5 X the dose rate at 30 cm except when:
  Foreign material exclusion and configuration controls prohibit the placement of signs.
  Infrequent access to the area limits the value of the posting as determined by RP supervision.
NISP Requirements
Hierarchy for Pocket Inserts

- Use pocket inserts below signs as needed to post hazards and entry requirements
- Use the following hierarchy from top to bottom:
  - External hazards.
  - Airborne hazards.
  - Contamination hazards.
  - Other information.
Catch Containments

- Use yellow material for catch containments to identify the contained leakage as contaminated.

- Ensure the catch containment and drain tubing is conspicuously labeled for containing contamination if the containment is located in a non-contaminated area.
Labeling Requirements

- Label containers with radioactive material using a radiation symbol trefoil and the words “Caution Radioactive Material” as shown.

- Add precautionary information for any of the following conditions:
  - Dose rates are ≥ 2 mrem/hour on contact with the contents in the container.
  - Smearable contamination ≥ 1,000 dpm/100 cm² is accessible if the container is opened.
  - Contents originated in a Level 3 Alpha Area.
  - Contents contain discrete radioactive particles.
Exceptions to Labeling Requirements

- Containers are not required to be labeled under step 3.4.1 for any of the following conditions:
  - Containers holding licensed material in quantities less than the quantities listed in 10 CFR 20, Appendix C
  - Containers holding licensed material in concentrations less than those specified in 10 CFR 20, Appendix B, Table 3.
  - Containers attended by an individual who takes the precautions necessary to prevent the exposure of individuals in excess of the limits established by 10 CFR 20.
  - Containers when they are in transport and packaged and labeled in accordance with the regulations of the Department of Transportation.
  - Containers that are accessible only to individuals authorized to handle or use them, or to work in the vicinity of the containers, if the contents are identified to these individuals by a readily available written record.
Exceptions to Labeling Requirements (Continued)

- Containers are not required to be labeled under step 3.4.1 for any of the following conditions (Continued):
  - Installed manufacturing or process equipment, such as reactor components, piping, and tanks.
  - Containers holding licensed material (other than sealed sources that are either specifically or generally licensed) that are within an RCA if the containers are:
    - Conspicuously marked (such as by providing a system of color coding of containers) commensurate with the radiological hazard;
    - Accessible only to individuals who have sufficient instruction to minimize radiation exposure while handling or working in the vicinity of the containers; and
    - Subject to plant procedures to ensure they are appropriately labeled before being removed from the posted area.
Postings Required for Ladder Storage

- Post ladder storage areas, staged ladders, portable power lifts, and teletowers with a sign stating “Contact RP Prior to Working or Climbing Above 7 Feet.”

- Place a posting on each side of power lifts and teletowers when in service to ensure the caution is conspicuous.

| **RADIATION AREA**
≥ 4 & < 80 mrem/hour @ 30 cm | • Posting must be conspicuous at entry point and external to the Radiation Area.  
• Boundary demarcation or barricades are not required.  
• Avoid a single posting for a very large area or room if most of the area or room is < 4 mrem/hour. In such conditions, post the discrete areas or rooms ≥ 4 mrem/hour. | Standard Radiation Sign with the following:  
• RADIATION AREA |

Table from NISP-04, Radiological Posting and Labeling.
CONSTRUCTING POSTED AREAS
GENERAL POSTED AREA CONSTRUCTION

- Posted Area Boundaries:
  - Yellow and magenta rope, ribbons, chains, or physical barriers such as existing walls, fences or railings, or a radiation trained worker.
    - HRA’s require the use of a physical barrier.
  - Appropriate radiological warning signs.
GENERAL POSTED AREA CONSTRUCTION

- Place rope/ribbon ≈ three feet above the floor.
- Do not place ropes on:
  - Valve handwheels.
  - Instrument tubing.
  - Snubbers.
  - Rotating equipment.
  - Hot pipes or equipment.
GENERAL POSTED AREA CONSTRUCTION

- Yellow and magenta tape or paint can be used as a boundary for areas below the threshold for posting High Radiation Areas where rope, ribbon, chain, stanchions, etc. are not practical.
- Place radiological information at the entrance to the posted area.
GENERAL POSTED AREA CONSTRUCTION

- Use gates, stanchions, hooks, etc.
- Allow for safe personnel passage.
- Prevent inadvertent operation:
  - Valves,
  - Switches,
  - Instrumentation or other vital equipment while entering/exiting the posted area.
GENERAL POSTED AREA CONSTRUCTION

▪ For HRAs:
  – Free egress requirements maintained while area is occupied.
  – Area must be barricaded and conspicuously posted.
    OR
  – Guarded

▪ For LHRAs, & VHRAs:
  – Free egress requirements maintained while area is occupied.
  – Area must be barricaded and conspicuously posted.
  – Locked or Guarded
GENERAL POSTED AREA CONSTRUCTION

▪ Sign visibility:
  – The sign must be seen from ANY direction.

▪ General Rule of Thumb:
  – If one can stand anywhere at the posted area boundary and NOT see a sign, additional signs are needed.
  – If at least one sign is visible from all posted area locations, then there is sufficient posting.
GENERAL POSTED AREA CONSTRUCTION

- Ensure signs at the different access points contain identical information.
Operating Experience
Operating Experience

Uncontrolled Locked High Radiation Area

- The failure of a resin transfer pump at Perry Nuclear Power Plant resulted in a water and resin spill.
  - The water and resin overflowed into the hallway, resulting in conditions that met the criteria for a Locked High Radiation Area (LHRA).

- RP did not survey for changing radiological conditions for approximately five days.
  - This resulted in an undetected and uncontrolled LHRA.

- During these five days, several individuals were allowed access into the uncontrolled LHRA without required briefings or an understanding of the hazards present.
  - No individuals exceeded exposure limits or received dose rate alarms during this time period.
Operating Experience
Uncontrolled Locked High Radiation Area

- Causes:
  - Weaknesses in response to new or changing conditions, along with shortfalls in communication and documentation.
    - RP technicians did identify changing radiological conditions, but did not document or investigate the extent of the changes, nor did they update any postings.
  - Operational and equipment challenges in the radiological waste hampered the organization’s response to changing plant and radiological conditions.
    - This lead to an insufficient questioning attitude and an incomplete understanding of the emergent conditions.
    - Water on the floor of the building was a normal occurrence, and it was assumed that the RP technicians had evaluated the radiological conditions properly.
Operating Experience
Uncontrolled Locked High Radiation Area

▪ Lessons Learned
  – When the potential exists for changing radiological conditions within a work area, RP technicians should:
    ▪ Fully assess and understand the risk
    ▪ Perform regular monitoring
    ▪ Update postings and documentation
    ▪ Control all aspects of the work activity to ensure worker protection
Enabling Objective

1. Define the following terms
   – RCA
   – Radiation Area
   – High Radiation Area
   – Locked High Radiation Area
   – Very High Radiation Area
   – Neutron Area
   – Radiography Area
   – Contaminated Area
   – High Contamination Area
   – DRP Area
   – Alpha 2 Area
   – Alpha 3 Area
   – Airborne Radioactivity Area
   – Hot spot
Enabling Objective

2. State the proper hierarchy for pocket inserts on postings.
3. State posting requirements for catch containments.
4. State posting and boundary requirements for a Neutron area.
5. State postings and boundary requirements for a Radiography area.
6. Identify the posting and boundary requirements for the following:
   - High Radiation Area
   - Locked High Radiation Area
   - Very High Radiation Area
   - Contaminated Area
   - High Contamination Area
   - DRP Area
   - Airborne Radioactivity Area
Enabling Objective

7. State posting required for a ladder storage area (to include staged ladders, portable power lifts, and teletowers).

8. State the boundary controls and posting requirements for an Alpha 2 Area.

9. State the boundary controls and posting requirements for an Alpha 3 Area.

10. State the labeling requirements for containers with radioactive material.

11. State the containers which are exceptions to labeling requirements for containers with radioactive materials.
Terminal Objective

- When working as an RP technician at a US nuclear utility, individual will be able to establish boundaries, barriers, and postings necessary to inform workers of the radiological hazards in the work area in accordance with the standards of NISP-RP-04, Nuclear Industry Standard Process for Radiological Posting and Labeling.
